21ME62

Sixth Semester B.E. Degree Examination, June/July 2024 Heat Transfer

Time: 3 hrs.

Max. Marks: 100

Note: 1. Answer any FIVE full questions, choosing ONE full question from each module.
2. Use of HMT data handbook is permitted.

Module-1

- 1 a. Explain the modes of Heat Transfer. (04 Marks)
b. Derive General 3D heat conduction equation in Cartesian coordinates. (08 Marks)
c. An exterior wall of a house may be approximated by a 0.1 m layer of common brick ($K = 0.7 \text{ W/m}^\circ\text{C}$) followed by a 0.04 m layer of gypsum plaster ($K = 0.48 \text{ W/m}^\circ\text{C}$). What thickness of loosely packed rock wool insulation ($K = 0.065 \text{ W/m}^\circ\text{C}$) should be added to reduce the heat loss or (gain) through the wall by 80 percent? (08 Marks)

OR

- 2 a. Derive 2-D Heat conduction equation for Hollow cylinder. (10 Marks)
b. A standard cast iron pipe (ID = 50 mm and OD = 55 mm) is insulated with 85 percent magnesium insulation ($K = 0.02 \text{ W/m}^\circ\text{C}$). Temperature at the interface between the pipe and insulation is 300°C . The allowable heat loss through the pipe is 600 W/m length of pipe and for safety, the temperature of the outside surface of insulation must not exceed 100°C . Determine:
(i) Minimum thickness of insulation required
(ii) The temperature of inside surface of pipe assuming its thermal conductivity $20 \text{ W/m}^\circ\text{C}$. (10 Marks)

Module-2

- 3 a. Derive heat dissipation equation for a fin with insulated end. (10 Marks)
b. A steel rod ($K = 32 \text{ W/m}^\circ\text{C}$), 12 mm in diameter and 60 mm long, with an insulated end is to be used as a spine. It is exposed to surroundings with a temperature of 60°C and a heat transfer coefficient of $55 \text{ W/m}^2\text{C}$. The temperature at the base of the fin is 95°C . Determine:
(i) Fin efficiency
(ii) The temperature at the edge of the spine
(iii) The heat dissipation (10 Marks)

OR

- 4 a. Obtain an expression for Instantaneous and total heat transfer for lumped system analysis of heat conduction. (12 Marks)
b. A 50 cm \times 50 cm copper slab 6.25 mm thick has a uniform temperature of 300°C . Its temperature is suddenly lowered to 36°C . Calculate the time required for the plate to reach the temperature of 108°C . Take $\rho = 9000 \text{ kg/m}^3$, $c = 0.38 \text{ kJ/kg}^\circ\text{C}$, $k = 370 \text{ W/m}^\circ\text{C}$ and $h = 90 \text{ W/m}^2\text{C}$. (08 Marks)

Module-3

- 5 a. Explain: (i) Stefan-Boltzman law (ii) Wien's displacement law (iii) Radiation shield
(iv) Radiosity (v) Black body (10 Marks)

- b. Consider two large parallel plates one at $t_1 = 727^\circ\text{C}$ with emissivity $\varepsilon_1 = 0.8$ and other at $t_2 = 227^\circ\text{C}$ with emissivity $\varepsilon_2 = 0.4$. An aluminum radiation shield with an emissivity, $\varepsilon_3 = 0.05$ on both sides is placed between the plates. Calculate the percentage reduction in heat transfer rate between the two plates as a result of the shield. (10 Marks)

OR

- 6 a. Explain how Stefan Boltzman constant is determined using Stefan Boltzman apparatus experimentally. (10 Marks)
- b. An electric heating system is installed in the ceiling of a room 5 m (length) \times 5m (width) \times 2.5 m (height). The temperature of the ceiling is 315 K whereas under equilibrium conditions the walls are at 295 K, if the floor is non-sensitive to radiations and the emissivities of the ceiling and wall are 0.75 and 0.65 respectively. Calculate the radiant heat loss from the ceiling to the walls. (10 Marks)

Module-4

- 7 a. Explain briefly with sketches:
 (i) Boundary layer thickness (ii) Thermal boundary layer thickness (08 Marks)
- b. A cylindrical body of 300 mm diameter and 1.6 m height is maintained at a constant temperature is 36.5°C . The surrounding temperature is 13.5°C . Find out the amount of heat to be generated by the body per hour if $\rho = 1.025 \text{ kg/m}^3$, $C_p = 0.96 \text{ kJ/kg}^\circ\text{C}$, $V = 15.06 \times 10^{-6} \text{ m}^2/\text{s}$, $K = 0.0892 \text{ kJ/m-h}^\circ\text{C}$ and $\beta = \frac{1}{298} \text{ K}^{-1}$. Assume $Nu = 0.12 (\text{Gr.Pr})^{1/3}$. (12 Marks)

OR

- 8 a. Explain the significance of:
 (i) Reynolds number (ii) Prandtl number
 (iii) Grashoff number (iv) Stenton number (10 Marks)
- b. Air at 30°C and at atmospheric pressure flows at a velocity of 2.2 m/s over a plate maintained at 90°C . The length and the width of the plate are 900 mm and 450 mm respectively. Using exact solution calculate the heat transfer rate from:
 (i) First half of the plate (ii) Full plate (iii) Next half of the plate
 The properties of air at temperature 60°C are $\rho = 1.06 \text{ kg/m}^3$, $\mu = 7.211 \text{ kg/hm}$, $V = 18.97 \times 10^6 \text{ m}^2/\text{s}$, $\text{Pr} = 0.696$, $k = 0.02894 \text{ W/m}^\circ\text{C}$. (10 Marks)

Module-5

- 9 a. With a neat sketch, explain the different regimes of pool boiling. (10 Marks)
- b. A vertical plate 350 mm high and 420 mm wide at 40°C is exposed to saturated steam at 1 atm. Calculate the following:
 (i) The film thickness at the bottom of plate.
 (ii) The maximum velocity at the bottom of plate
 (iii) The total heat flux to the plate. (10 Marks)

OR

- 10 a. Derive the expression for LMTD of a parallel flow heat exchanger. (10 Marks)
- b. Water ($C_p = 4200 \text{ J/kg}^\circ\text{C}$) enters a counter flow double pipe heat exchanger at 38°C flowing at 0.076 kg/s . It is heated by oil ($C_p = 1880 \text{ J/kg}^\circ\text{C}$) flowing at the rate of 0.152 kg/s from an inlet temperature of 116°C . For an area of 1 m^2 and $U = 340 \text{ W/m}^2^\circ\text{C}$. Determine the total heat transfer rate. (10 Marks)
